

VIBACK

When mass-placement of concrete is required there is no greater labor savings tool than VIBACK. The unique hydraulic vibrator design yields maximum concrete consolidation and compaction, ideal for dam construction job sites. Available as a complete base machine or "attachement" to use on existing base machines.

Immediate consolidation of concrete allowing the base machine to rest on top the freshly placed concrete for maximum efficiency. Base machine can move freely about the job site.

Optional rotating head allowing vibrator assembly to work in restricted space as well as closely against existing structures. Labor reduction is significant, saving time and reducing cost.
